Table of Contents

Notations

- K: an arbitrary field with $\mathrm{Char}\, K \neq 2$.
- X, Y, Z: variables.
- $\mathbb{V} = \{v : v \in \mathbb{V}\} = \{p : \text{prime number}\} \cup \{\infty\}$.
- $\mathbb{Q}_v$: completion of $\mathbb{Q}$
  - $\mathbb{Q}_\infty = \mathbb{R}$
  - $\mathbb{Q}_p$: with respect to the p-adic valuation.

- $f(\vec{X}) = \sum_{i,j=1}^{n} a_{ij} X_i X_j$ is a quadratic form
  - $a_{ij} = a_{ji} \in K$.
  - $\vec{X} = (X_1, \cdots, X_n) \in K^n$
- The matrix $A_f = (a_{ij})$ associated with f is symmetric.
- The pair (K^n, f) is a quadratic space.
  - $f \sim g$: $\exists P \in GL(n, K)$ s.t. $A_f = P^T A_g P$.
  - $f \sim g \iff (K^n, f) \cong (K^n, g)$.

Case over $\mathbb{R}$

- Invariants:
  - Rank: $\operatorname{rank} f = n$.
  - Signature: $(r, s) :=$ (#positive eigenvalues, #negative eigenvalues).

Theorem (Sylvester's Law of Inertia)

Let $f = \sum_{i,j=1}^{n} a_{ij} X_i X_j$ be a quadratic form of rank n over $\mathbb{R}$. Then

$$f \sim X_1^2 + X_2^2 + \cdots + X_r^2 - X_{r+1}^2 - \cdots - X_{r+s}^2.$$

Problem: How to Classify Quadratic Forms over $\mathbb{Q}$?

Table of Contents

Background (17-18th Century)

f represents $a \in K$: $\exists x \in K^n \setminus \{0\}$ s.t. $f(x) = a$.

Figure: Fermat

Figure: Gauss

Figure: Lagrange

Background (19-20th Century)

Remark

Equivalent quadratic forms represent exactly the same set of numbers.

Theorem (Hasse-Minkowski)

f represents 0 over $\mathbb{Q}$ iff it represents 0 over all $\mathbb{Q}_v$.

Representation of Numbers

$f(X_1, \cdots, X_n)$ and $g(X_1, \cdots, X_m)$

- $f \oplus g = f(X_1, \cdots, X_n) + g(X_{n+1}, \cdots, X_{n+m})$

Proposition

Let $a \in K^\times$. The following are equivalent:

- *f represents a*
- *$f \sim f_1 \oplus aZ^2$ where f_1 is of rank $\operatorname{rank} f - 1$.*
- *$f_a = f \oplus -aZ^2$ represents 0.*

Corollary (Hasse-Minkowski Theorem)

f represents $a \in \mathbb{Q}^\times$ over $\mathbb{Q}$ iff it represents a over all $\mathbb{Q}_v$.

- Apply the Hasse-Minkowski Theorem to $f_a = f \oplus -aZ^2$.

Table of Contents

Decomposing Quadratic Spaces

Theorem (Witt's Cancellation)

$f_1 \oplus g_1 \sim f_2 \oplus g_2$ *and* $g_1 \sim g_2$ *implies* $f_1 \sim f_2$.

- (V, Q): A quadratic space.
- (U, Q) and (W, Q): Isometric subspaces.

U^{\perp} \arrow[r, "\cong"] & W^{\perp}
\end{tikzcd}
$$

Figure: Witt's Cancellation Theorem

$f \sim g$ over $\mathbb{Q}$

Theorem (Minkowski)

Two non-degenerate quadratic forms of rank n over $\mathbb{Q}$ are equivalent iff they are equivalent over each $\mathbb{Q}_v$.

- By the Hasse-Minkowski Theorem, the numbers represented by both f and g over $\mathbb{Q}$ is also the same.
- Take a represented, $f \sim aZ^2 \oplus f_1$ over $\mathbb{Q}$ and $\mathbb{Q}_v$. Similarly for g.
- By Witt's cancellation, we have $f_1 \sim g_1$ over $\mathbb{Q}_v$ for all $v \in \mathbb{V}$.
- By induction on rank n, $f_1 \sim g_1$ over $\mathbb{Q}$, thus $f \sim g$ over $\mathbb{Q}$.

Table of Contents

General Ideas over K

- Reduced Form: $f \sim \sum_{i=1}^{n} a_i X_i^2$, where $a_i \in K^\times/(K^\times)^2$.
  - Invariant rank: non-degenerate.
  - Symmetric matrices: diagonal.
  - $\sum a_i b_i^2 X_i^2 \sim \sum a_i X_i^2$: square-free.

- If $f \sim g$, $\det(A_f) = \det(P^T A_g P) = \det(A_g)\det(P)^2$
  - Invariant discriminant: $d = \det(A)$ in $K^\times/(K^\times)^2$.

- $\mathbb{R}^\times/(\mathbb{R}^\times)^2 \cong \{1, -1\}$.
- $\mathbb{Q}_p^\times/(\mathbb{Q}_p^\times)^2 \cong K_4 = \{1, a, p, ap\}$ $(p \neq 2)$.
- $\mathbb{Q}_2^\times/(\mathbb{Q}_2^\times)^2 \cong (\mathbb{Z}/2\mathbb{Z}) \times (\mathbb{Z}/2\mathbb{Z}) \times (\mathbb{Z}/2\mathbb{Z})$.

Binary Quadratic Forms over $\mathbb{Q}_p$ for $p \neq 2$

Theorem (Classification of Binary Quadratic Forms over $\mathbb{Q}_p$ for $p \neq 2$)

Two binary quadratic forms over $\mathbb{Q}_p$ for $p \neq 2$ are equivalent if and only if they have the same discriminant d and a comman represented number a.

- Take a represented by f.
- $f \sim f_1 \oplus aZ^2$ where $\operatorname{rank} f_1 = 1$.
- Then $f_1 = adX^2$. Thus f is determined.

Binary Quadratic Forms over $\mathbb{Q}_p$ for $p \neq 2$

- Entry: the discriminant of $\alpha X^2 + \beta Y^2$
- a: same color, same equivalent class
  - mutually distinct if colored black
- $\boxed{a}$: boxed quadratic forms don't represent 1

$\alpha \backslash \beta$	1	a	p	ap
1	1	a	p	ap
a		1	$\boxed{ap}$	$\boxed{p}$
p			1	$\boxed{a}$
ap				1

(a) $p \equiv 1 \pmod 4$

$\alpha \backslash \beta$	1	a	p	ap
1	1	a	p	ap
a		1	$\boxed{ap}$	$\boxed{p}$
p			$\boxed{1}$	a
ap				$\boxed{1}$

(b) $p \equiv 3 \pmod 4$

Table: Classification of binary quadratic forms over $\mathbb{Q}_p$ for $p \neq 2$

Hilbert Symbol

$$f = aX^2 + bY^2 \text{ represents } 1$$
$$\iff$$
$$Z^2 - aX^2 - bY^2 \text{ represents } 0.$$

- Hilbert symbol:

$$(a, b) = \begin{cases} 1 & Z^2 - aX^2 - bY^2 \text{ represents 0,} \\ -1 & \text{Otherwise.} \end{cases}$$

Computation of Hilbert Symbol

$(\cdot,\cdot)$	1	a	p	ap
1	1	1	1	1
a		1	-1	-1
p			1	-1
ap				1

(a) $p \equiv 1 \pmod 4$

$(\cdot,\cdot)$	1	a	p	ap
1	1	1	p	ap
a		1	-1	-1
p			-1	1
ap				-1

(b) $p \equiv 3 \pmod 4$

Table: Hilbert Symbol of $\mathbb{Q}_p$ for $p \neq 2$

- Hilbert symbol is a symmetric non-degenerate bilinear form.

Hasse Invariant

- $f = a_1X_1^2 + \cdots + a_nX_n^2$.
- Hasse invariant: $\varepsilon(f) = \prod_{i<j}(a_i, a_j)$

- $f_1 = a_2X_2^2 + \cdots + a_nX_n^2$.
- $d(f) = \prod_{i=1}^n a_i = a_1 \prod_{i=2}^n a_i = a_1 d(f_1)$.
- $\varepsilon(f) = \prod_{1\le i<j\le n}(a_i, a_j) = \varepsilon(f_1)\cdot(a_1, a_2\cdots a_n) = \varepsilon(f_1)\cdot(a_1, a_1 d(f))$.

Representation of Numbers over $\mathbb{Q}_p$

f represents 0 over $\mathbb{Q}_p$ iff:

- For $n = 2$: $d = -1$;
- For $n = 3$: $(-1, -d) = \varepsilon$;
- For $n = 4$: $d \neq 1$ or $d = 1$ and $\varepsilon = (-1, -1)$;
- For $n \geq 5$: no conditions.

By applying the result to $f_a = f \oplus -aZ^2$, we obtain:

f represents $a \in \mathbb{Q}_p^\times$ iff:

- For $n = 1$: $a = d$;
- For $n = 2$: $(a, -d) = \varepsilon$;
- For $n = 3$: $a \neq d$ or $a = d$ and $\varepsilon = (-1, -d)$;
- For $n \geq 4$: no conditions.

Table of Contents

$f \sim g$ over $\mathbb{Q}_p$

Theorem

Two non-degenerate quadratic forms of rank n over $\mathbb{Q}_p$ are equivalent iff they have the same discriminant d and Hasse invariant ε.

- f, g have same d and ε, thus there exists $a \in \mathbb{Q}_p^\times$ which both represented by f and g.
- Then $f \sim f_1 \oplus aZ^2$, where f_1 is of rank $n-1$. Similarly for g.
- d and ε of f_1 can be determined:
  - $d(f_1) = a \cdot d(f) = a \cdot d(g) = d(g_1)$
  - $\varepsilon(f_1) = \varepsilon(f) \cdot (a, ad(f)) = \varepsilon(g) \cdot (a, ad(g)) = \varepsilon(g_1)$
- Thus f_1, g_1 share the same d and ε. QED by induction.

Classification of Quadratic Forms over $\mathbb{Q}_p$

Fix (d, ε), all possible quadratic forms over $\mathbb{Q}_p$:

- $n = 1$: $f = dX^2$
- $n = 2$: $f = aX^2 + adY^2$, for
  - $a \in \mathbb{Q}_p^\times/(\mathbb{Q}_p^\times)^2$
- $n \geq 3$: $f = aX_1^2 + bX_2^2 + abdX_3^2 + \sum_{i>3} X_i^2$, for
  - $a : a \neq -d$
  - $b : (b, -ad) \cdot (a, -d) = \varepsilon$

Classification of Quadratic Forms over $\mathbb{Q}$

Theorem (Product Formula)

$(a,b)_v = 1$ *for almost all* $v \in \mathbb{V}$ *and* $\prod_{v\in\mathbb{V}}(a,b)_v = 1$

The invariants d_v and ε_v satisfy the following relations:

- $\varepsilon_v = 1$ for almost $v \in \mathbb{V}$, and $\prod_{v\in\mathbb{V}} \varepsilon_v = 1$.
- $\varepsilon_v = 1$ if $n = 1$ and if $n = 2$ and if the image d_v of d in $\mathbb{Q}_p^\times/{\mathbb{Q}_p^\times}^2$ is equal to -1.
- $r, s \geq 0$ and $r + s = \mathrm{rank}$.
- $d_\infty = (-1)^s$
- $\varepsilon_\infty = (-1)^{s(s-1)/2}$

Thank You!
